# BENZIMIDAZOLONE CHYMASE INHIBITORS

## APPLICATION DATA

This application is a 371 National Stage filing of PCT/US2008/063630 filed on May 15, 2008. This application also claims benefit to U.S. provisional application Ser. No. 60/939,452 filed on May 22, 2007.

## FIELD OF THE INVENTION

The invention relates to small molecule inhibitors which are useful in treating various diseases and conditions involving Chymase.

## BACKGROUND OF THE INVENTION

In cardiac tissue of cardiomyopathic patients, transforming growth factor- $\beta$  (TGF- $\beta$ ), which has been demonstrated to stimulate cardiac fibrosis in animal models (Kuwahara, et al. Circulation, 2002, 106, 130), is increased (Li et al., Circulation, 1997, 96, 874). In the myocardial fibrotic area, it is known that mast cells are increased in number and may contribute to the development of fibroblast proliferation in cardiac tissues of patients with cardiomyopathy (Patella et al., Circulation, 1998, 97, 971). Chymase is a chymotrypsin-like serine protease contained in the secretory granules of mast cells. Although the precise physiological roles of Chymase have not been completely revealed, Chymase is known to transform angiotensin I to angiotensin II and may contribute to activation of TGF- $\beta$ , matrix proteases, and cytokines (Taipale et al., J. Biol. Chem., 1995, 270, 4689; Takai et al., Life Sci., 1996, 58, 591; Takai et al., Circulation, 1999, 100, 654).

A potent and selective Chymase inhibitor may have potential use as a treatment of chronic heart failure, atherosclerosis, restenosis, and myocardial infarction by inhibiting local production of angiotensin II in the heart and release of TGF- $\beta$ , two independent mediators of cardiac remodeling. An inhibitor may also have potential use for treatment of mast cell mediated diseases such as dermatitis, asthma, chronic obstructive pulmonary disease (COPD), and pulmonary inflammation, since Chymase is implicated in microvascular leakage, neutrophil accumulation, the stimulation of mucus secretion, and the modulation of cytokines (He et al., Eur. J. Pharmacol., 1998, 352, 91).

Several small molecule Chymase inhibitors have been reported to be efficacious in the cardiomyopathic hamster model of heart failure (Takai et al. J. Pharmacol. Exp. Ther. 2003, 305, 17), in carotid artery injury by a balloon catheter in dogs (Takai et al. J. Pharmacol. Exp. Ther. 2003, 304, 841), and in the hamster left anterior descending coronary artery ligation model of heart failure (WO 03/018061). Additionally, a Chymase inhibitor has been demonstrated to be efficacious in a sheep asthma model (WO 2005/073214). However, there is no example of commercialization of a Chymase inhibitor as a medicament.

## SUMMARY OF THE INVENTION

It is therefore an object of the invention to provide a small molecule a Chymase inhibitor as defined herein, and pharmaceutical compositions thereof.

It is also an object of the invention to provide methods of using said Chymase inhibitors to treat various diseases and conditions related thereto.

2

It is a further object of the invention to provide processes of preparing said Chymase inhibitors.

In all the compounds disclosed hereinabove in this application, in the event the nomenclature is in conflict with the structure, it shall be understood that the compound is defined by the structure.

The invention includes the use of any compounds of described above containing one or more asymmetric carbon atoms may occur as racemates and racemic mixtures, single enantiomers, diastereomeric mixtures, and individual diastereomers. All such isomeric forms of these compounds are expressly included in the present invention. Each stereogenic carbon may be in the R or S configuration, or a combination of configurations.

Some of the compounds of formula (I) can exist in more than one tautomeric form. The invention includes methods using all such tautomers.

All terms as used herein in this specification, unless otherwise stated, shall be understood in their ordinary meaning as known in the art. For example, C<sub>1-4</sub>alkoxy includes the organic radical C<sub>1-4</sub>alkyl with a terminal oxygen, such as methoxy, ethoxy, propoxy, butoxy.

All organic radicals: alkyl, alkenyl and alkynyl groups, or such groups which are incorporated in other radicals such as acyl and alkoxy, shall be understood as being branched or unbranched where structurally possible and unless otherwise specified, and may be partially or fully halogenated.

The term "lower" referred to above and hereinafter in connection with organic radicals or compounds respectively

defines such as branched or unbranched with up to and including 7, preferably up to and including 4 and advantageously one or two carbon atoms.

A cyclic group shall be understood to mean carbocycle, heterocycle or heteroaryl, each may be partially or fully halogenated.

An acyl group is a radical defined as —C(O)—R, where R is an organic radical or a cyclic group. Acyl represents, for example, carbocyclic or heterocyclic aryl, cycloalkylcarbonyl, (oxa or thia)-cycloalkylcarbonyl, lower alkanoyl, (lower alkoxy, hydroxy or acyloxy)-lower alkanoyl, (mono- or dicarbocyclic or heterocyclic)-(lower alkanoyl or lower alkoxy-, hydroxy- or acyloxy-substituted lower alkanoyl), or biaryl.

Carbocycles include hydrocarbon rings containing from three to fourteen carbon atoms. These carbocycles may be either aromatic either aromatic or non-aromatic ring systems. The non-aromatic ring systems may be mono- or polyunsaturated, monocyclic, bicyclic or tricyclic and may be bridged. Preferred carbocycles include but are not limited to cyclopropyl, cyclobutyl, cyclopentyl, cyclopentenyl, cyclohexyl, cyclohexenyl, cycloheptanyl, cycloheptenyl, phenyl, benzyl, indanyl, indenyl, benzocyclobutanyl, dihydronaphthyl, tetrahydronaphthyl, naphthyl, decahydronaphthyl, benzocycloheptanyl, adamantyl, norbornyl, fluorene, and benzocycloheptenyl. Certain terms for cycloalkyl such as cyclobutanyl and cyclobutyl shall be used interchangeably.

The term "heterocycle" refers to a stable nonaromatic 4-8 membered (but preferably, 5 or 6 membered) monocyclic or

non-aromatic 8-11 membered bicyclic heterocycle radical which may be either saturated or unsaturated. Each heterocycle consists of carbon atoms and one or more, preferably from 1 to 4 heteroatoms chosen from nitrogen, oxygen and sulfur. The heterocycle may be attached by any atom of the cycle, which results in the creation of a stable structure. Unless otherwise stated, heterocycles include but are not limited to, for example pyrrolidinyl, pyrrolinyl, morpholinyl, thiomorpholinyl, thiomorpholinyl sulfoxide, thiomorpholinyl sulfone, dioxalanyl, piperidinyl, piperazinyl, tetrahydrofuranyl, tetrahydropyranyl, tetrahydrofuranyl, 1,3-dioxolanone, 1,3-dioxanone, 1,4-dioxanyl, piperidinonyl, tetrahydropyrimidinyl, pentamethylene sulfide, pentamethylene sulfoxide, pentamethylene sulfone, tetramethylene sulfide, tetramethylene sulfoxide and tetramethylene sulfone.

The term "heteroaryl" shall be understood to mean an aromatic 5-8 membered monocyclic or 8-11 membered bicyclic ring containing 1-4 heteroatoms such as N, O and S. Unless otherwise stated, such heteroaryls include aziridinyl, thienyl, furanyl, isoxazolyl, oxazolyl, thiazolyl, thiadiazolyl, pyrazolyl, pyrrolyl, imidazolyl, pyridinyl, pyrimidinyl, pyrazinyl, pyridazinyl, pyranyl, quinoxalanyl, indolyl, benzimidazolyl, benzoxazolyl, benzopyrrolyl, benzothiazolyl, benzothieryl, quinolinyl, quinazolinyl, naphthyridinyl, indazolyl, triazolyl, pyrazolo[3,4-b]pyrimidinyl, purinyl, pyrrolo[2,3-b]pyridinyl, pyrazolo[3,4-b]pyridinyl, tubercidinyl, oxazo[4,5-b]pyridinyl, tetrazol-5-yl, 5-oxo-1,2,4-oxadiazol-3-yl, 5-oxo-1,2,4-thiadiazol-3-yl, 5-thioxo-1,2,4-oxadiazol-3-yl, 5-thioxo-1,2,4-thiadiazol-3-yl, 3-oxo-1,2,4-oxadiazol-5-yl, N3,5-dioxo-5-oxadiazolidino, 2-oxo-1,3,4-oxadiazol-2-yl, 3-oxo-1,2,4-triazol-5-yl, 2,dioxo-benzothiadiazin-6-yl, 1,2-dioxo-3-hydroxy-3-cyclobuten-4-yl, and imidazo[4,5-b]pyridinyl.

The term "heteroatom" as used herein shall be understood to mean atoms other than carbon such as oxygen, nitrogen, sulfur and phosphorous.

As used herein, "nitrogen" and "sulfur" include any oxidized form of nitrogen and sulfur and the quaternized form of any basic nitrogen. All heteroatoms in open chain or cyclic radicals include all oxidized forms.

In all alkyl groups or carbon chains one or more carbon atoms can be optionally replaced by heteroatoms: O, S or N, it shall be understood that if N is not substituted then it is NH, it shall also be understood that the heteroatoms may replace either terminal carbon atoms or internal carbon atoms within a branched or unbranched carbon chain. Such groups can be substituted as herein above described by groups such as oxo to result in definitions such as but not limited to: alkoxycarbonyl, acyl, amido and thioxo.

The term "aryl" as used herein shall be understood to mean aromatic carbocycle or heteroaryl as defined herein. The compounds of the invention are only those which are contemplated to be 'chemically stable' as will be appreciated by those skilled in the art. For example, a compound which would have a 'dangling valency', or a 'carbanion' are not compounds contemplated by the inventive methods disclosed herein.

The invention includes pharmaceutically acceptable derivatives of compounds of formula (I). A "pharmaceutically acceptable derivative" refers to any pharmaceutically acceptable salt or ester, or any other compound which, upon administration to a patient, is capable of providing (directly or indirectly) a compound useful for the invention, or a pharmacologically active metabolite or pharmacologically active residue thereof. A pharmacologically active metabolite shall be understood to mean any compound of the invention capable of being metabolized enzymatically or chemically. This includes, for example, hydroxylated or oxidized derivative compounds of the formula (I).

Simple chemical transformations include hydrolysis, oxidation and reduction. Specifically, when a prodrug is administered to a patient, the prodrug may be transformed into a compound disclosed hereinabove, thereby imparting the desired pharmacological effect.

The compounds described herein are either commercially available or can be made by methods and any necessary intermediates well known in the art.

The organic phase was dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated to afford 0.44 g (89%) of the desired product as a white solid. This product was used for the next reaction without further purification. LCMS (ESMS): m/z 315.79 (M+H<sup>+</sup>).

3-(5-Cyano-2-nitro-phenylamino)-propionic acid ethyl ester

To a solution of 3-Fluoro-4-nitrobenzonitrile (1.0 g, 6.0 mmol) in DMA (5 mL) were added Beta-Alanine ethyl ester HCl (1.4 g, 9.03 mmol) and DIPEA (1.6 mL, 9.03 mmol). The reaction mixture was stirred at room temperature for 16 h (the reaction was completed; the reaction mixture turned to orange from yellow in color). The reaction mixture was then diluted with ethyl acetate and washed with water (x4). The organic phase was then dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated to afford 1.53 g (96%) of the desired product as yellow solid.

1-(1,4-Dimethyl-1H-indol-3-ylmethyl)-3-isopropenyl-5,6-dimethyl-1,3-dihydro-benzimidazol-2-one

To a solution of 1-Isopropenyl-5,6-dimethyl-1,3-dihydro-benzimidazol-2-one (0.25 g, 1.2 mmol) in DMF (10 mL) was added  $K_2CO_3$  (0.51 g, 3.7 mmol). The reaction mixture was heated to 90° C. and stirred for 20 min. (1,4-Dimethyl-1H-indol-3-ylmethyl)-trimethyl-ammonium; iodide (0.64 g, 1.8 mmol) was then added to the reaction mixture and stirred for another 3 h. The reaction mixture was treated with ethyl acetate and washed with water. The resulting residue was purified by silica gel prep TLC using 4:1 Hexane:ethyl acetate as an eluent to afford 0.35 g the desired product as an off-white solid. LCMS (ESMS):  $m/z$  360.33 ( $M+H^+$ ).

1-(1,4-Dimethyl-1H-indol-3-ylmethyl)-5,6-dimethyl-1,3-dihydro-benzimidazol-2-one

To 1-(1,4-Dimethyl-1H-indol-3-ylmethyl)-3-isopropenyl-5,6-dimethyl-1,3-dihydro-benzimidazol-2-one (0.35 mmol) in MeOH (5 mL) was added water (5 mL) and cone. HCl (3 mL). The reaction mixture was heated to 60° C. for 2 h. The reaction mixture turned into pink in color and heterogeneous (milky solution). The TLC indicated that the reaction was complete and clean. The reaction mixture was therefore diluted with  $CH_2Cl_2$  and washed with water. The organic phase remained heterogeneous (milky with fine powder). The organic phase was filtered through a fine filter to collect some of the solid which was partially soluble in DMSO- $d_6$ . <sup>1</sup>H-NMR indicated this filtered solid being the desired product. Therefore, the organic phase was concentrated without drying with  $Na_2SO_4$  to afford a pink solid. <sup>1</sup>H-NMR of this product in DMSO- $d_6$  matched well with the previous filtered solid.

3-[3-(1,4-Dimethyl-1H-indol-3-ylmethyl)-5,6-dimethyl-2-oxo-2,3-dihydro-benzimidazol-1-yl]-hexanoic acid ethyl ester

A mixture of 1-(1,4-Dimethyl-1H-indol-3-ylmethyl)-5,6-dimethyl-1,3-dihydro-benzimidazol-2-one (0.1 g, 0.31 mmol),  $K_2CO_3$  (87 mg, 0.63 mmol) and ethyl trans-2-hexenoate (0.45 g, 3.1 mmol) was heated to 130° C. for 20 min in a microwave. Since the starting material was not soluble in ethyl trans-2-hexenoate even after heating, DMA (2 mL) was added to the reaction mixture and heated again at 150° C. for 30 min. Although the un-reacted starting material was

present, the reaction mixture was diluted with ethyl acetate and washed with water ( $\times 4$ ). The organic phase was dried over  $\text{Na}_2\text{SO}_4$  and concentrated. The resulting heterogeneous residue was purified by silica gel prep TLC using 4:1 hexanes: ethyl acetate as an eluent to afford 25 mg of the desired product as an oil. LCMS (ESMS):  $m/z$  462.88 ( $\text{M}+\text{H}^+$ ).

3-{3-[(1,4-dimethyl-1H-indol-3-yl)methyl]-5,6-dimethyl-2-oxo-2,3-dihydro-1H-benzimidazol-1-yl}hexanoic acid

To a solution of the ester (25 mg, 0.05 mmol) in MeOH (5 mL) was added 2N NaOH (5 mL). The reaction mixture was stirred at room temperature for 3 h. When the reaction was complete, the mixture was treated with 1N HCl and extracted with  $\text{CH}_2\text{Cl}_2$ . The organic phase was dried over  $\text{Na}_2\text{SO}_4$  and concentrated. The resulting residue was purified by silica gel prep TLC using 10:1  $\text{CH}_2\text{Cl}_2$ :MeOH as an eluent to afford 22 mg of the title compound as a pale gray solid. LCMS (ESMS):  $m/z$  434.72 ( $\text{M}+\text{H}^+$ ).

5,6-Dimethyl-1-(4-methyl-benzo[b]thiophen-3-ylmethyl)-1,3-dihydro-benzimidazol-2-one

To a slurry of 5,6-Dimethyl-2-benzimidazolinone (0.2 g, 1.2 mmol) in DMA (2 mL) (poor solubility) were added  $\text{K}_2\text{CO}_3$  (0.10 g, 0.74 mmol) and trimethyl-(4-methyl-benzo[b]thiophen-3-ylmethyl)-ammonium; iodide (0.21 g, 0.62 mmol). The heterogeneous reaction mixture was heated to 130° C. for 10 min. Since there was still un-reacted starting material left, NaH (15 mg, 0.38 mmol) was added to the reaction mixture and heated to 150° C. for 10 min. The reaction was complete. The reaction mixture was then diluted with ethyl acetate (some MeOH was added to solubilize the reaction mixture into the organic phase) and washed with water ( $\times 5$ ). The organic phase was dried over  $\text{Na}_2\text{SO}_4$  and concentrated. The resulting solid had poor solubility. To the solid,  $\text{CH}_2\text{Cl}_2$  was added and the resulting solid was filtered. The filtered solid was identified as the desired product (with a minimal amount of excess 5,6-Dimethyl-2-benzimidazolinone). Therefore, this filtered solid was used for the next reaction. LCMS (ESMS):  $m/z$  323.13 ( $\text{M}+\text{H}^+$ ).

The reaction mixture was heated to 130° C. for 20 min in a microwave. The reaction mixture was then diluted with ethyl acetate (since there was some insoluble material left, MeOH was added to the solution mixture to solubilize the material). The organic phase was dried over  $Na_2SO_4$  and concentrated. The resulting residue was purified by silica gel prep TLC using 10:1  $CH_2Cl_2$ :MeOH as an eluent to afford the title compound as an off-white solid. LCMS (ESMS):  $m/z$  454.20 ( $M+H^+$ ). However, this product also contains approximately 50% of the other isomer, 3-{3-[(5-chloro-1,2,3-trimethyl-1H-indol-7-yl)methyl]-5-methyl-2-oxo-2,3-dihydro-1H-benzimidazol-1-yl}pentanoic acid.

## Example 33

3-(2-Oxo-2,3-dihydro-benzimidazol-1-yl)-hexanoic acid ethyl ester (80 mg, 0.29 mmol), prepared as described above, 4-chloro-3-hydroxymethyl-indole-1-carboxylic acid tert-butyl ester (282 mg, 1 mmol) and triphenylphosphene (223 mg, 0.85 mmol) were combined in a reaction vial and THF (1 mL) was added. The mixture was stirred until complete solution was attained, then cooled to 0° C., and diisopropylazodicarboxylate (0.165 mL, 0.85 mmol) was added dropwise. The reaction mixture was heated in the microwave at 130° C. for 20 minutes, cooled, then diluted with THF (1 mL) and treated directly with the Amberlyst® resin (2.2 g, 2.95 mmol). This reaction mixture was agitated overnight and the resin was then filtered and washed with DMF (2×3 mL) and several portions of methanol. The product was eluted by treating the resin with a 20% solution of formic acid in methanol (2×3 mL) and washing with methanol (3 mL). The combined eluant and final wash was evaporated and redissolved in dichloromethane (1 mL). To this solution was added TFA (0.2 mL) and the reaction mixture was agitated for 1 h. The solvent was evaporated and the residue was purified by preparative HPLC using an acetonitrile/water/formic acid gradient providing the title compound (8 mg, 7%) LCMS (ESMS):  $m/z$  412 ( $M+H^+$ ).

Advantageously, the compounds may then be administered together in a single dosage form. In some embodiments, the pharmaceutical compositions comprising such combinations of compounds contain at least about 5%, but more preferably at least about 20%, of a compound (w/w) or a combination thereof. The optimum percentage (w/w) of a compound of the invention may vary and is within the purview of those skilled in the art. Alternatively, the compounds may be administered separately (either serially or in parallel). Separate dosing allows for greater flexibility in the dosing regime.

As mentioned above, dosage forms of the above-described compounds include pharmaceutically acceptable carriers and adjuvants known to those of ordinary skill in the art. These carriers and adjuvants include, for example, ion exchangers, alumina, aluminum stearate, lecithin, serum proteins, buffer substances, water, salts or electrolytes and cellulose-based substances. Preferred dosage forms include, tablet, capsule, caplet, liquid, solution, suspension, emulsion, lozenges, syrup, reconstitutable powder, granule, suppository and transdermal patch. Methods for preparing such dosage forms are known (see, for example, H. C. Ansel and N. G. Popovich, *Pharmaceutical Dosage Forms and Drug Delivery Systems*, 5th ed., Lea and Febiger (1990)). Dosage levels and requirements are well-recognized in the art and may be selected by those of ordinary skill in the art from available methods and techniques suitable for a particular patient. In some embodiments, dosage levels range from about 1-1000 mg/dose for a 70 kg patient. Although one dose per day may be sufficient, up to 5 doses per day may be given. For oral doses, up to 2000 mg/day may be required. As the skilled artisan will appreciate, lower or higher doses may be required depending on particular factors. For instance, specific dosage and treatment regimens will depend on factors such as the patient's general health profile, the severity and course of the patient's disorder or disposition thereto, and the judgment of the treating physician.

The term "patient" includes both human and non-human mammals.

The term "effective amount" means an amount of a compound according to the invention which, in the context of which it is administered or used, is sufficient to achieve the desired effect or result. Depending on the context, the term effective amount may include or be synonymous with a pharmaceutically effective amount or a diagnostically effective amount.

The terms "pharmaceutically effective amount" or "therapeutically effective amount" means an amount of a compound according to the invention which, when administered to a patient in need thereof, is sufficient to effect treatment for disease-states, conditions, or disorders for which the compounds have utility. Such an amount would be sufficient to elicit the biological or medical response of a tissue, system, or patient that is sought by a researcher or clinician. The amount of a compound of according to the invention which constitutes a therapeutically effective amount will vary depending on such factors as the compound and its biological activity, the composition used for administration, the time of administration, the route of administration, the rate of excretion of the compound, the duration of treatment, the type of disease-state or disorder being treated and its severity, drugs used in

combination with or coincidentally with the compounds of the invention, and the age, body weight, general health, sex, and diet of the patient. Such a therapeutically effective amount can be determined routinely by one of ordinary skill in the art having regard to their own knowledge, the prior art, and this disclosure.

The term "diagnostically effective amount" means an amount of a compound according to the invention which, when used in a diagnostic method, apparatus, or assay, is sufficient to achieve the desired diagnostic effect or the desired biological activity necessary for the diagnostic method, apparatus, or assay. Such an amount would be sufficient to elicit the biological or medical response in a diagnostic method, apparatus, or assay, which may include a biological or medical response in a patient or in a in vitro or in vivo tissue or system, that is sought by a researcher or clinician. The amount of a compound according to the invention which constitutes a diagnostically effective amount will vary depending on such factors as the compound and its biological activity, the diagnostic method, apparatus, or assay used, the composition used for administration, the time of administration, the route of administration, the rate of excretion of the compound, the duration of administration, drugs and other compounds used in combination with or coincidentally with the compounds of the invention, and, if a patient is the subject of the diagnostic administration, the age, body weight, general health, sex, and diet of the patient. Such a diagnostically effective amount can be determined routinely by one of ordinary skill in the art having regard to their own knowledge, the prior art, and this disclosure.

The terms "treating" or "treatment" mean the treatment of a disease-state in a patient, and include:

- (i) preventing the disease-state from occurring in a patient, in particular, when such patient is genetically or otherwise predisposed to the disease-state but has not yet been diagnosed as having it;
- (ii) inhibiting or ameliorating the disease-state in a patient, i.e., arresting or slowing its development; or
- (iii) relieving the disease-state in a patient, i.e., causing regression or cure of the disease-state.

#### In vitro Assay for Inhibition of Chymase

Chymase assays were performed in a total volume of 15  $\mu$ L in Corning black opaque 384-well microliter plates with a non-binding surface (Corning, N.Y.). The assay buffer was comprised of 20 mM Tris HCl pH 8.0, 50 mM NaCl, 0.01% CHAPS. The test compounds were serially diluted 3-fold with neat DMSO in a 96-well polypropylene plate from a 10 mM DMSO stock to give the 10 point dose response curve. 3  $\mu$ L of the resulting DMSO solution were transferred to a 384-well polypropylene plate in duplicate, and 37  $\mu$ L of assay buffer was added. Chymase was added to the assay plate in 3  $\mu$ L of assay buffer followed by 2  $\mu$ L of the appropriate compound dilution using a PlateMate Plus (Matrix Technologies Corp., Hudson, N.H.). The reaction was initiated by the addition of 10  $\mu$ L rhodamine 110, bis-(succinoyl-1-alanyl-1-alanyl-1-prolyl-1-phenylalanylamide) (American Peptides, Sunnyvale, Calif.) in assay buffer containing 150  $\mu$ M tris(2-carboxyethyl)phosphine (TCEP, Pierce Chemical, Rockford, Ill.) using a Multidrop (Thermo Electron Corp., Waltham, Mass.). Final assay concentrations were 500 pM chymase, 100 nM substrate, 100  $\mu$ M TCEP, and 1% DMSO. The plates were incubated at 28° C. and 80% humidity for 1 hour, at which time the fluorescence was read on a Viewlux 1430 Microplate Imager (Perkin Elmer Life Sciences, Boston, Mass.) with 485 nm excitation, 530 nm emission, and a fluo-

rescein dichroic mirror. The percentage of control values were calculated relative to assay blanks containing complete reaction minus chymase and a 100% control containing assay buffer with 1% DMSO in place of compound. IC50 values were obtained by fitting the data using XLFit4 (IDBS Software).

Preferred compounds of the invention have an activity of 1 microMolar or less.
